

## P5 Culture Project Directions

For this project we are creating something in P5 with the shapes we learned that tells about our cultural background. You can do some searching for ideas but some ideas can include a flag of your country, a religious symbol, a favorite place you like to visit that you can create with the shapes, food, etc. The choice is yours. You will also use color to fill in the shapes with corresponding shapes.

Once you have your Sketch finished, you will then be designing a page with HTML and CSS in the same program. The reason for this is that it will be like a web page that showcases your cultural symbol. You will need to include 3 paragraphs with one containing a list of at least three things. It can be an ordered list or an unordered list. You also need to include at least two separate headings using h1 - h6 - any two of them. You need to use a break between the paragraphs and use the p for paragraph. You will also need to use a web link to a resource that tells about your cultural background and lastly you will use an image that represents the design that you created in your sketch.

The following tags will be needed. You may use more if you want to use a cheat sheet.

<h1></h1> - <h6></h6> - for headings

<p></p> - for paragraphs

<ul></ul> - for unordered lists

<li></li> - need for each list item

<ol></ol> - ordered list

<li></li> - need for each list item

<br> break between lines - no closing tag needed

 either a link to an image must be .jpg .jpeg, .png, .gif - no closing tag needed

<a href = "URL-web link">Name to click on</a>for example need a word in the middle to make the clickable link.

<a href="http://google.com">Google</a>

Once you have created the text and have formatted it with the HTML, you will then use the style.css page to create some additional decoration to your page. I want you to use background color, text size, text color, border on images, etc.

Some examples:

```
h1 {
color: blue;
}
h2 {
Text-align: right;
color: red;
}
*{background-color: antiquewhite;
}
```

```
img {  
float: left;  
width: 250px;  
margin: 10px;  
border-color: saddlebrown;  
border-width: 4px;  
border-style: solid;  
border-radius: 10px;  
}
```

And you can use class or div which would work for only a small section, image, or line of text

You may also use a CSS Cheatsheet to help you.

You may also use [code.org](https://code.org) and lesson 9 and 11 help you with images and CSS.
